BUILDING A SMARTER AI-POWERED SPAM CLASSIFIER :

Problem Definition:

The problem is to build an AI-powered spam classifier that can accurately distinguish between spam and non-spam messages in emails or text messages. The goal is to reduce the number of false positives (classifying legitimate messages as spam) and false negatives (missing actual spam messages) while achieving a high level of accuracy.

Introduction :

The problem is to build an AI-powered spam classifier that can accurately distinguish between spam and non-spam messages in emails or text messages. The goal is to reduce the number of false positives (classifying legitimate messages as spam) and false negatives (missing actual spam messages) while achieving a high level of accuracy.

Steps :

- **Data Collection**:

  Gather a labeled dataset of emails or text messages, with examples of both spam and non-spam (ham) messages.
- Data Preprocessing:
- Tokenization: Break text into words or tokens.
- Stopword Removal: Eliminate common words like "and," "the," etc.
- Lemmatization or Stemming: Reduce words to their base form.
- Feature Extraction:
- Convert text data into numerical features using techniques like TF-IDF (Term Frequency-Inverse Document Frequency) or word embeddings.
- **Split Data**:

  Divide the dataset into training and testing sets.
- Model Selection:

- Choose a machine learning algorithm like Naive Bayes, Support Vector Machines, or deep learning techniques (e.g., LSTM or CNN for text classification).
- **Model Training**:

  Train the chosen model on the training data.
- **Model Evaluation**:

  Evaluate the model's performance on the test data using metrics like accuracy, precision, recall, and F1-score.
- **Hyperparameter Tuning**:

  Optimize the model's hyperparameters to improve performance.

  Cross-Validation (Optional): Use k-fold cross-validation to ensure the model's robustness.

Deployment: Implement the trained model in a real-world environment for spam classification.

- **Monitoring and Updating**: Continuously monitor the model's performance and update it as needed.
- **User Interface** (Optional): Create a user-friendly interface for users to interact with the spam classifier.

Processing Steps

Understanding the Data :

In [1]:

```
#importing   libraries
import pandas as pd
import numpy as np
from sklearn.model_selection import train_test_split
from sklearn.feature_extraction.text import TfidfVectorize
from sklearn.linear_model import LogisticRegression
from sklearn.metrics import accuracy_score, confusion_matrix,
roc_curve, roc_auc_score
import nltk
from nltk.corpus import stopwords
from collections import Counter
```

```
#libraries for data visualization
import matplotlib.pyplot as plt
import seaborn as sns
%matplotlib inline
```

Conclusion

An AI-powered smart spam classifier offers significant benefits by efficiently filtering out unwanted messages, emails, or content. It enhances user experience by reducing exposure to spam, phishing attempts, and irrelevant information. In conclusion, AI-driven spam classifiers contribute to a safer and more organized digital environment, ultimately saving time and ensuring a more enjoyable online experience for users.
